To: Subject:

## Please search the following:

1. SEQ ID NO:35

2. oligo search of at least 20 contiguous bases of SEQ ID NO:35. Please search both commercial and issued patents databases. Thanks

The present sequence is that of an isolated nucleic acid, designated ESP002_C2, of Exophiala spinifera isolate ESP002, which encodes an amino polyol amine oxidase (APAD, see AAPS8900) capable of degrading fumonishin, its Mydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of ESP002 mycelial DNA using primers based on APAO of E. Spinifera ATCC 74269. The invention provides ARAD polynucleotides (see AAZS8383-87) and polypeptides (see AAYS8900-05) of E. Spinifera and Finnocladicals atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Transgenic plants can be regenerated from the transformed plant cells. Also provided are methods for expressing both APAO enzyme in prokaryotic and non-plant enkaryotic producing APAO enzyme in prokaryotic and non-plant enkaryotic systems. Transgenic plants capable of degrading fumonisin or of graducing the degrading enzymes are provided. Methods for systems. Transgenic plants capable of degrading fumonisin or of elecontification of granin, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CACATCGGCGTAGGCCCAAACGAAGCGAGGTATGTGACAATAGCTGGACAGATTGGACAA 120

The present sequence is that of an isolated nucleic acid, designated ESP002_C3, of Exophiala spinifera isolate ESP002, which encodes an amino polyol amine oxidase (APAO, see AAY58901) capable of degrading fumonisin, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of ESP002 mycelial DNA using primers based on APAO of E. spinifera AACS 44269. The invention provides APAO polynucleotides (see AAX583183-87) and polypeptides (see AAX58900-05) of E. spinifera and ENINOCIDATE atrovitens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Transgenic plants can be regenerated from the transformed plant cells. Also provided are methods for expressing both APAO enzyme in prokaryotic and non-plant eukaryotic systems. Transgenic plants capable of degrading fumonisin or of producing the degrading enzymes are provided. Methods for systems. Transgenic plants capable of degrading fumonisin or of cetoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CICCAGAGGACGACGGAAAIICAAICCAICAAGCACAAGACGGIACAACCACIACAGCI 720

                                                                                     The present sequence is that of an isolated nucleic acid, designated ESP003_C12, of Exophiala spinifera isolate ESP002, which encodes an amino polyol amine oxidase (APAO, see AAY58902) capable of degrading fumonisin, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of ESP003 mycelial DNA using primers based on AAPO of E. spinifera AAC58383-87) and polypeptides (see AAY58900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Transgenic plants can be regenerated from the

                                                                                                                                                       ij
transformed plant cells. Also provided are methods for express both APAO and a fumonishr-esterase in a transgenic plant, and producing APAO enzyme in prokaryotic and non-plant eukaryotic systems. Transgenic plants capable of degrading fumonish or producing the degrading enzymes are provided. Methods for detoxification of grain, grain processing, sliage, food crops in animal feed and rumen microorganisms are also disclosed. A polynucleotide is also useful as a selectable marker.

The present sequence is that of an isolated nucleic acid, designated RAT011-C2, of Rhinocladiella atrovirens isolate RAT011, which encodes an amino polyol amine oxidase (APAO, see AAY58904) capable of degrading fumonisin, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of RAT011 mycelial DNA using primers based on APAO polymucleotides (see AAX58383-87) and polypeptides (see AAX58900-05) of R. atrovirens and Exophiala spinifera. The polymucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing
                                                                                                                                                      Amino polyol amine oxidase; fumonisin; mycotoxin; transgenic plant; detoxification; animal feed; silage; selectable marker; ds.
                                                                                                                         Rhinocladiella atrovirens amino polyol amine oxidase RAT011-C2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fungus infection. Transgenic plants can be regenerated from the transformed plant cells. Also provided are methods for expressing both APAO and a fumonisin-sterase in a transgenic plant, and for producing APAO enzyme in prokaryotic and non-plant eukaryotic systems. Transgenic plants capable of degrading fumonisin or of producing the degrading enzymes are provided. Methods for detoxification of grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful for detecting and
mycotoxin in processed

```
The present sequence is that of an isolated nucleic acid, cheating and all of Rhinocladiella atrovirens isolate RAT011, which encodes an amino polyol amine oxidase (APAO, see AAYS8905) capable of degrading fumonisin, its hydrolysis product API, and catated mycotoxins. The DNA was obtained by PCR amplification of RAT011 mycelial DNA using primers based on APAO of E. spinifers ATC 74269. The invention provides APAO polynucleotides (see CAAS8838787) and polypeptides (see AAYS8900-05) of R. atrovirens and Exophiala spinifera. The polynucleotides are used to transformed plant cells normally susceptible to Fusarium or other toxin-producing transformed plant cells. Also provided are methods for expressing both APAO and a fumonish-escrace in a transgenic plant, and for producing APAO encoming a transgenic plant, and for producing APAO encourse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 CACATCGGCGTAGGCCCAAACGAAGCGAGGTATGTGACAATAGCTGGACAGATTGGACAA 120

Transgenic plants capable of degrading fumonisin or producing the degrading enzymes are provided. Methods for detoxification of grain, grain processing, silage, food crops in animal feed and rumen microorganisms are also disclosed. A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ÷
                                                                                                                                                                                                                                                                                                                                                            The present sequence is that of an isolated nucleic acid, designated RAT011-C1, of Rhinocladiella atrovirens isolate RAT011, which encodes an amino polyol amine oxidase (APAO, see ARY58903) capable of degrading fumonisin, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of RAT011 mycelial DNA using primers based on APAO of E. spinifera ATCC 74269. The invention provides APAO polynucleotides (see AAT58938-87) and polypeptides (see AAY58900-05) of R. atrovirens and Exophiala spinifera. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing tungus infection. Transgenic plants can be regenerated from the transformed plant cells. Also provided are methods for expressing both APAO and a fumonish-esterase in a transgenic plant, and for systems. Transgenic plants can hon-plant eukaryotic systems. Transgenic plants capable of degrading fumonish or of producing the degrading enzymes are provided. Methods for detoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO plynucleotide is also useful as a selectable marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180

The present sequence is that of the coding region of full-length amino polyol amine oxidase (APAO) CDNA of Exophiala spinifera 2141.10. APAO is capable of degrading fumonisin, its hydrolysis product API, and related mycotoxins. The invention provides APAO polynucleotides (see AAZ58383-87) and polypeptides (see AAX58900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Transgenic plants can be reconsisted from the transformed plant cells. Also provided are methods for expressing both APAO and a fumonishin-esterase in a transgenic plant, and for producing APAO enzyme in prokaryotic and non-plant eukaryotic systems. Transgenic plants capable of degrading con-plant eukaryotic systems. Transgenic plants capable of degrading (Monohish for detoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO polynucleotide is also useful as a selectable marker.
                                                                                                                 οţ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GACGCTTTGGGCGTGACAGACCCAGCCTACGAGAAACAGGTTGCCCAAGCATTCGCCAAT 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a full length Exophiala spinifera aminopolyol amine oxidase (APAO). The enzyme has homlology to the flavin containing amine oxidase family, that oxidise primary amine to an adelyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungit that produce mycotoxins and/or to degrade such mycotoxins
Aminopolyol amine oxidase; APAO; mycotoxin degradation; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (e.g. during ensilaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related sequences from other organisms. ```
The present sequence is that of a polynucleotide encoding a GST.APAO fusion protein (see AAY58918) composed of glutathione S transferase and Exophiala spinifera amino polyol amino oxidase (APAO). 2 Codons of the APAO coding region have been altered by site-directed mutagenesis in order to change the glycosylation stren of the fusion protein. These were the replacement of AAT (Asn) by TCC (Ser) at codon 430, and replacement of AAT (Asn) at codon 435. APAO is capable of degrading fumonisin and related mycotoxins. The invention provides APAO polynucleotides can and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other coxin-producing fungus infection. Also provided are methods for expressing APAO in transgenic plants, prokaryotic and non-plant cukaryotic systems. Methods for detecxification of grain, grain processing, silage, food crops and in animal feed and rumen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            detecting and in processed

The present sequence encodes a fusion protein of GST and a mutated Exophiala spinifera aminopolyol amine oxidase (APAO). The APAO protein has been mutated to remove potential glycosylation sites at postions 201 and 206. The APAO enzyme has homology to the flavin contraining amine oxidase family, that oxidise primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Contrainting or mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins has APAO generates, as a by-product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants of peroxide which is itself an antimicrobial and stimulates the plants of plants (particularly maize) that are resistant to Fusarium or other fungi that produce mycotoxins and/or to degrade such mycotoxins con polypeptides is as selection markers for plant transformation; and to isolate related sequences from other organisms. The APAO polypeptides or used to degrade mycotoxins in plant materials, including expression in engineered bacteria and fungi, e.g. rumen microflora.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 CACATCGGCGTAGGCCCAAACGAAGCGAGGTATGTGACAATAGCTGGACAGATTGGACAA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ŏ
                                                                                                                                                                                                                                                     The present sequence is that of polynucleotide k0n0-395_5.4, which encodes a truncated, but still functional, amino polyol amine oxidase (trApko-1, see AAY58907 and AAY58908). The polynucleotide was obtained by 3' and 5' RACE PCR using k0n0-395.5 (see AA258388), a partial APAO CDNA of Exphiala spinifera. APAO is capable of degrading fumonisin, its hydrolysis product API and related myxocxins. The invention provides APAO polynucleotides (see AA258383-87) and polypeptides (see AA258900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Also provided are methods for expressing APAO in transgenic plants, prokaryotic and non-plant eukaryotic systems. Methods for expressing APAO in transgenic plants, animal feed and rumen microorganisms are also disclosed. APAO and in animal feed and rumen microorganisms are also disclosed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The present sequence encodes an Exophiala spinifera aminopolyol amine oxidase (APAO). The enzyme has homlology to the flavin containing amine oxidase family, that oxidise primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungithat produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensilaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related account of the organisms. The APAO polypeptides are used to
                                                                                              Aminopolyol amine oxidase; APAO; mycotoxin degradation; antimicrobial; plant fungal invasion; hydrogen peroxide; Fusarium; fungi; ss.

The present sequence is that of a polynucleotide encoding a fusion protein (see AAYS8915) composed of the barley alpha-amylase signal peptide, and a bacterial fumonisin esterase (BEST1) joined via a peptide linker to K:trAPAO (see AAYS8909), a truncated, but functional, amino polyol amino exidase of Exophiala spinifera. The construct was designed for expression and secretion in plants of a hybrid protein having BEST1 and AAPO activity. The invention provides AAPO polynucleotides (see AAZS883*87) and polypeptides (see AAYS8900-05) of E. spinifera and Rhinocladiella atrovirens. The conscription of Fusarium or other toxin-producing fungus infection. Also provided are methods for expressing AAPO, optionally as a consistent with fumosinin esterase, in transgenic plants, prokaryotic and non-plant eukaryotic systems. Methods for expressing characterial plants, in animal feed and rumen microorganisms are also disclosed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TGAGAAGGACCTAAAACTTGCCTGCTGTTCTCAGCGTGGCAAACCAGATCACACGCGCTCT 1008

The present sequence encodes a fusion protein of Exophiala spinifera aminopolyol amine oxidase (APAO) and a bacterial fumonisin esterase. The APAO enryme has homilology to the flavin containing amine oxidase family, that oxidise primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungi that produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensilaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related sequences from other plant materials, including expression in engineered bacteria and fungi,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```

```
The present sequence is that of a polynucleotide encoding a fusion protein (see AAY58914) composed of the barley alpha-amylase signal peptide, and Exophiala spinifera fumonistin esterase (ESP1) joined via a peptide linker to K:trAPAO (see AAY58909), a truncated, but functional, amino polyol maine oxidase of E. spinifera. The construct was designed for expression and secretion in plants of a hybrid protein having ESP1 and APAO activity. The invention provides APAO polynucleotides (see AAX58383*87) and polypeptides (see AAX58900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Also provided are methods for expressing APAO, optionally as a conscient with fumosinin esterase, in transgenic plants, prokaryotic and non-plant eukaryotic systems. Methods for detoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2015
